Grading:

For each question, exactly one of the four proposed answers is correct. If the good answer and only the good answer box is crossed \Rightarrow +1 point. If one bad answer box is crossed and no other box is crossed $\Rightarrow -\frac{1}{3} = -0.333$ point. If 0 or more than 1 answer box is crossed \Rightarrow +0 point.

← Please encode your SCIPER number here and write your full name in the box below. ↓

Name, First Name:

.....

Question 1 A sends an Ethernet frame that contains an IP packet to C. The MAC destination address observed at A is...

- | | |
|---|---|
| <input type="checkbox"/> The MAC address of the interface of S1 that links to A. | <input type="checkbox"/> The MAC address of the interface of R1 that links to S1. |
| <input type="checkbox"/> The MAC address of the interface of S1 that links to R1. | <input type="checkbox"/> The MAC address of A. |
| <input type="checkbox"/> The MAC address of the interface of R1 that links to C. | <input type="checkbox"/> The MAC address of C. |

Question 2 With DHCP a host can acquire...

- | | |
|---|---|
| <input type="checkbox"/> its IP address, its network mask and the IP address of a DNS server but never the IP address of its default gateway. | <input type="checkbox"/> its IP address, its network mask and the IP address of its default gateway but never the IP address of a DNS server. |
| <input type="checkbox"/> its IP address, its network mask, the IP address of its default gateway and the IP address of a DNS server. | <input type="checkbox"/> its IP address, the IP address of its default gateway and the IP address of a DNS server but never its network mask. |

Question 3 How many frames can be transmitted in parallel in this network ?

- | | |
|-------------------------------------|-----------------------------|
| <input type="checkbox"/> ≥ 4 . | <input type="checkbox"/> 2. |
| <input type="checkbox"/> 1. | <input type="checkbox"/> 3. |

Question 4 A web server at EPFL sends an IP packet to Elaine, who is at home behind a NAT. No VPN is used. The IP destination address of the packet sent by the web server is ...

- | | |
|---|--|
| <input type="checkbox"/> the IP address of a DNS server. | <input type="checkbox"/> the private (LAN) IP address of Elaine's NAT. |
| <input type="checkbox"/> the IP address of Elaine's device in her home network. | <input type="checkbox"/> the public (WAN) IP address of Elaine's NAT. |

Question 5 When a layer-2 switch forwards a packet...

- | | |
|--|--|
| <input type="checkbox"/> it decrements the TTL if it is an IPv4 packet but does not modify the HL if it is an IPv6 packet. | <input type="checkbox"/> it decrements the HL if it is an IPv6 packet but does not modify the TTL if it is an IPv4 packet. |
| <input type="checkbox"/> it decrements the TTL if it is an IPv4 packet and the HL if it is an IPv6 packet. | <input type="checkbox"/> it does not modify the IPv4 TTL nor the IPv6 HL. |

Question 6 A sends an Ethernet frame that contains an IP packet to C. The MAC destination address observed at A is...

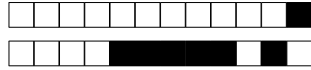

- | | |
|---|---|
| <input type="checkbox"/> The MAC address of the interface of S1 that links to A. | <input type="checkbox"/> The MAC address of the interface of S2 that links to S1. |
| <input type="checkbox"/> The MAC address of the interface of S1 that links to S2. | <input type="checkbox"/> The MAC address of C. |
| <input type="checkbox"/> The MAC address of the interface of S2 that links to C. | <input type="checkbox"/> The MAC address of A. |

Question 7 Elaine, at home in Lausanne behind a NAT, receives an IP packet from a web server in California. The IP source address of the packet received by Elaine is ...

- | | |
|---|--|
| <input type="checkbox"/> the IP address of the web server. | <input type="checkbox"/> the IP address of Elaine's DHCP server. |
| <input type="checkbox"/> the private (LAN) IP address of the NAT. | <input type="checkbox"/> the public (WAN) IP address of the NAT. |

Question 8 Joe builds a network by first connecting 3 bridges to each other, then connecting each host to one of the 3 bridges.

- | | |
|---|---|
| <input type="checkbox"/> This does not work because the topology has a loop. | <input type="checkbox"/> This does not work because the spanning tree protocol disables at least one port to prevent a loop from happening. |
| <input type="checkbox"/> This works for unicast frames but not for broadcast frames (such as ARP requests). | <input type="checkbox"/> This works because bridges compute shortest paths to each destination. |
| <input type="checkbox"/> This works because the spanning tree protocol disables at least one port to prevent a loop from happening. | |

Question 9 The goal of an ARP request is to...

- | | |
|---|---|
| <input type="checkbox"/> Determine the MAC address of an interface that has a given IP address. | <input type="checkbox"/> Determine the IP address of an interface that has a given MAC address. |
| <input type="checkbox"/> Determine the MAC address of the DNS server. | <input type="checkbox"/> Determine the IP address of the default gateway. |

Question 10 A host A receives an IPv6 packet with Hop Limit = 255.

- | | |
|---|---|
| <input type="checkbox"/> This is an error, a received packet should always have a Hop Limit < 255 . | <input type="checkbox"/> The source of the packet is at least 1 hop away from A . |
| <input type="checkbox"/> The source of the packet is 255 hops away from A . | <input type="checkbox"/> The source of the packet is onlink with A . |
